

The Price of Neutrality for the Ranked Pairs Method

Markus Brill **Felix Fischer**

Technische Universität München

University of Cambridge

26th AAI Conference

Social Choice

- ▶ Finite set A of alternatives
- ▶ Finite set $N = \{1, \dots, n\}$ of voters, each with preferences over A
- ▶ Preference profile $R \in \mathcal{L}(A)^n$
 $\mathcal{L}(A)$: set of rankings of A (complete, transitive, asymmetric)
- ▶ $a R_i b$ means voter i strictly prefers a over b
- ▶ Social choice function (SCF) $f : \mathcal{L}(A)^n \rightarrow 2^A$
- ▶ Social preference function (SPF) $f : \mathcal{L}(A)^n \rightarrow 2^{\mathcal{L}(A)}$
- ▶ Central problem: $L \subseteq A \times A$ such that $a L b$ if and only if $|\{i \in N : a R_i b\}| > |\{i \in N : b R_i a\}|$ not necessarily transitive

Two Variants of the Ranked Pairs Method

Ranked Pairs Rankings, Winners, and Unique Winners

Possible and Necessary Ranked Pairs Winners

Ranked Pairs

- ▶ Insert elements into the social ranking by decreasing majority margin, while maintaining transitivity

majority margin of a over b in R :

$$m_R(a, b) = |\{i \in N : a R_i b\}| - |\{i \in N : b R_i a\}|$$

2	1	3	1	2
<i>a</i>	<i>b</i>	<i>d</i>	<i>a</i>	<i>c</i>
<i>b</i>	<i>d</i>	<i>c</i>	<i>b</i>	<i>b</i>
<i>c</i>	<i>a</i>	<i>a</i>	<i>d</i>	<i>d</i>
<i>d</i>	<i>c</i>	<i>b</i>	<i>c</i>	<i>a</i>

Ranked Pairs

- ▶ Insert elements into the social ranking by decreasing majority margin, while maintaining transitivity

majority margin of a over b in R :

$$m_R(a, b) = |\{i \in N : a R_i b\}| - |\{i \in N : b R_i a\}|$$

2	1	3	1	2
a	b	d	a	c
b	d	c	b	b
c	a	a	d	d
d	c	b	c	a

Ranked Pairs

- ▶ Insert elements into the social ranking by decreasing majority margin, while maintaining transitivity

majority margin of a over b in R :

$$m_R(a, b) = |\{i \in N : a R_i b\}| - |\{i \in N : b R_i a\}|$$

2	1	3	1	2
a	b	d	a	c
b	d	c	b	b
c	a	a	d	d
d	c	b	c	a

Ranked Pairs

- ▶ Insert elements into the social ranking by decreasing majority margin, while maintaining transitivity

majority margin of a over b in R :

$$m_R(a, b) = |\{i \in N : a R_i b\}| - |\{i \in N : b R_i a\}|$$

2	1	3	1	2
a	b	d	a	c
b	d	c	b	b
c	a	a	d	d
d	c	b	c	a

Ranked Pairs

- ▶ Insert elements into the social ranking by decreasing majority margin, while maintaining transitivity

majority margin of a over b in R :

$$m_R(a, b) = |\{i \in N : a R_i b\}| - |\{i \in N : b R_i a\}|$$

2	1	3	1	2
a	b	d	a	c
b	d	c	b	b
c	a	a	d	d
d	c	b	c	a

Ranked Pairs

- ▶ Insert elements into the social ranking by decreasing majority margin, while maintaining transitivity

majority margin of a over b in R :

$$m_R(a, b) = |\{i \in N : a R_i b\}| - |\{i \in N : b R_i a\}|$$

2	1	3	1	2
a	b	d	a	c
b	d	c	b	b
c	a	a	d	d
d	c	b	c	a

Ranked Pairs

- ▶ Insert elements into the social ranking by decreasing majority margin, while maintaining transitivity

majority margin of a over b in R :

$$m_R(a, b) = |\{i \in N : a R_i b\}| - |\{i \in N : b R_i a\}|$$

2	1	3	1	2
a	b	d	a	c
b	d	c	b	b
c	a	a	d	d
d	c	b	c	a

Ranked Pairs

- ▶ Insert elements into the social ranking by decreasing majority margin, while maintaining transitivity

majority margin of a over b in R :

$$m_R(a, b) = |\{i \in N : a R_i b\}| - |\{i \in N : b R_i a\}|$$

2	1	3	1	2
a	b	d	a	c
b	d	c	b	b
c	a	a	d	d
d	c	b	c	a

Ranked Pairs

- ▶ Insert elements into the social ranking by decreasing majority margin, while maintaining transitivity

majority margin of a over b in R :

$$m_R(a, b) = |\{i \in N : a R_i b\}| - |\{i \in N : b R_i a\}|$$

2	1	3	1	2
a	b	d	a	c
b	d	c	b	b
c	a	a	d	d
d	c	b	c	a

Ranked Pairs

- ▶ Insert elements into the social ranking by decreasing majority margin, while maintaining transitivity

majority margin of a over b in R :

$$m_R(a, b) = |\{i \in N : a R_i b\}| - |\{i \in N : b R_i a\}|$$

- ▶ Definition depends on tie-breaking, two variants in the literature

2	1	3	1	2
a	b	d	a	c
b	d	c	b	b
c	a	a	d	d
d	c	b	c	a

Ranked Pairs

- ▶ Insert elements into the social ranking by decreasing majority margin, while maintaining transitivity

majority margin of a over b in R :

$$m_R(a, b) = |\{i \in N : a R_i b\}| - |\{i \in N : b R_i a\}|$$

- ▶ Definition depends on tie-breaking, two variants in the literature
- ▶ $\text{RPT}(R, \tau)$ for fixed *tie-breaking rule* $\tau \in \mathcal{L}(A \times A)$: resolute but not neutral
 - ▶ f is resolute if $|f(R)| = 1$ for every $R \in \mathcal{L}(A)^n$
 - ▶ f is neutral if $f(\pi(R)) = \pi(f(R))$ for every $R \in \mathcal{L}(A)^n$ and every permutation π of A

Ranked Pairs

- ▶ Insert elements into the social ranking by decreasing majority margin, while maintaining transitivity

majority margin of a over b in R :

$$m_R(a, b) = |\{i \in N : a R_i b\}| - |\{i \in N : b R_i a\}|$$

- ▶ Definition depends on tie-breaking, two variants in the literature
- ▶ $\text{RPT}(R, \tau)$ for fixed *tie-breaking rule* $\tau \in \mathcal{L}(A \times A)$: resolute but not neutral
 - ▶ f is resolute if $|f(R)| = 1$ for every $R \in \mathcal{L}(A)^n$
 - ▶ f is neutral if $f(\pi(R)) = \pi(f(R))$ for every $R \in \mathcal{L}(A)^n$ and every permutation π of A
- ▶ $\text{RP}(R) = \bigcup_{\tau \in \mathcal{L}(A \times A)} \text{RPT}(R, \tau)$: neutral and irresolute, original definition of Tideman

Ranked Pairs Rankings

Finding a ranked pairs ranking is in P

- ▶ execute ranked pairs method for a specific tie-breaking rule

Deciding whether a given ranking is a ranked pairs ranking is in P

- ▶ Zavist, Tideman (1989): L is ranked pairs ranking iff L is stack
 - ▶ say a attains b through L if there are distinct a_1, \dots, a_t such that $a_1 = a$, $a_t = b$, and for all $i = 1, \dots, t - 1$,

$$a_i L a_{i+1} \quad \text{and} \quad m_R(a_i, a_{i+1}) \geq m_R(b, a)$$
 - ▶ L is a *stack* if $a L b$ implies that a attains b through L
- ▶ deciding whether a ranking is a stack is in P
 - ▶ a attains b through L if there is a path from a to b in the directed graph $(A, \{(x, y) : x L y, m_R(x, y) \geq m_R(b, a)\})$

Ranked Pairs Winners

Finding a ranked pairs winner is in P

- ▶ execute ranked pairs method for a specific tie-breaking rule

Deciding whether a given alternative is a ranked pairs winner is NP-complete

- ▶ membership: ranked pairs ranking with alternative at the top is a certificate
- ▶ hardness: reduction from SAT

$$(v_1 \vee \bar{v}_2) \wedge (v_1 \vee v_2) \wedge (\bar{v}_1 \vee v_2)$$

—————> majority margin 2

—————> majority margin 4

variables

clauses

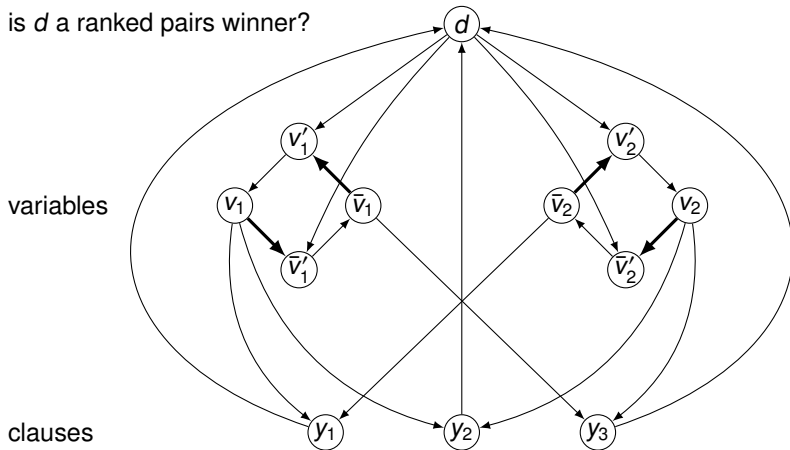

$$(v_1 \vee \bar{v}_2) \wedge (v_1 \vee v_2) \wedge (\bar{v}_1 \vee v_2)$$

—————> majority margin 2

—————> majority margin 4

is d a ranked pairs winner?

Unique Winners

Deciding whether an alternative is the unique ranked pairs winner is coNP-complete

- ▶ membership: ranked pairs ranking with some other alternative at the top is a certificate
- ▶ hardness: extend NP-hardness construction above

- ▶ d^* is unique ranked pairs winner iff formula is unsatisfiable
- ▶ if it is satisfiable, d^* can be inserted in second position of ranked pairs ranking with d at the top

Possible and Necessary Ranked Pairs Winners

- ▶ Consider partially specified preference profile R : for each i , R_i is transitive and asymmetric, but not necessarily complete
- ▶ Preference profile R' is a completion of R if for all $i \in N$ and $a, b \in A$, $a R b$ implies $a R' b$
- ▶ Alternative a is a *possible* ranked pairs winner for R if it is a ranked pairs winner for *some* completion R' of R
- ▶ Alternative a is a *necessary* ranked pairs winner for R if it is a ranked pairs winner for *every* completion R' of R

New Proofs for Old and New Results

Deciding whether an alternative is a possible ranked pairs winner is NP-complete (Xia and Conitzer, 2011)

- ▶ completion and stack with alternative at the top is a certificate
- ▶ hardness: possible winner problem with complete preference profile is equivalent to winner problem

New Proofs for Old and New Results

Deciding whether an alternative is a possible ranked pairs winner is NP-complete (Xia and Conitzer, 2011)

- ▶ completion and stack with alternative at the top is a certificate
- ▶ hardness: possible winner problem with complete preference profile is equivalent to winner problem

Deciding whether an alternative is a possible unique ranked pairs winner is both NP-hard (Xia and Conitzer, 2011) and coNP-hard

- ▶ coNP-hardness: possible unique winner problem with complete preference profile is equivalent to unique winner problem

New Proofs for Old and New Results

Deciding whether an alternative is a possible ranked pairs winner is NP-complete (Xia and Conitzer, 2011)

- ▶ completion and stack with alternative at the top is a certificate
- ▶ hardness: possible winner problem with complete preference profile is equivalent to winner problem

Deciding whether an alternative is a possible unique ranked pairs winner is both NP-hard (Xia and Conitzer, 2011) and coNP-hard

- ▶ coNP-hardness: possible unique winner problem with complete preference profile is equivalent to unique winner problem

Necessary ranked pairs winner: coNP-hard and NP-hard

Necessary unique ranked pairs winner: coNP-complete

Summary

- ▶ Finding *some* ranked pair winner is easy
- ▶ Deciding whether given alternative is ranked pairs winner is hard
- ▶ Results for possible and necessary winner problems (some of them known) as corollaries
- ▶ Tradeoff between neutrality and tractability: RPT fails neutrality, RP is intractable
- ▶ Similar tradeoff for single transferrable vote (Conitzer et al., 2009; Wichmann, 2004)
- ▶ Ranked pairs easier *on average* than other intractable SCFs, ties unlikely to occur for most reasonable distributions of preferences

Non-Anonymous Variants

- ▶ Resoluteness and neutrality at the cost of anonymity
 f is anonymous if $f(\pi(R)) = \pi(f(R))$ for every $R \in \mathcal{L}(A)^n$ and every permutation π of N
- ▶ Use preferences of specific voter, or chairperson, to break ties
- ▶ A priori: use preferences of chairperson to define $\tau \in \mathcal{L}(A \times A)$
efficiently computable
- ▶ A posteriori: choose $a \in \text{RP}(R)$ most preferred by chairperson
intractable
- ▶ Resoluteness, tractability, and appropriate generalizations of anonymity and neutrality by choosing chairperson at random

Thank you!
