Interacting Self-avoiding Walks The HP model

#### Lattice paths

Relevant as model of polymer chains

Lattice Walks

- $\bullet$  Physical space  $\to$  simple cubic lattice  $\mathbb{Z}^3$
- Ghost Polymer  $\rightarrow$  *n*-step random walk

#### Self-Avoiding Walks

• Polymer with Excluded Volume  $\rightarrow$  self-avoiding *n*-step random walk

#### Interacting Self-Avoiding Walks

- Quality of solvent  $\rightarrow$  short-range interaction  $\epsilon$ ,  $E_n(\varphi) = m(\varphi)\epsilon$
- Model for the collapse of (homo-)polymers

(신문) (신문)

4 A 1

Interacting Self-avoiding Walks The HP model

### The Effect of Self-Avoidance

Physically,

- Excluded volume changes the universality class
- Different critical exponents, e.g. length scale exponent changes

 $R \sim n^{\nu}$ 

where  $\nu=0.5$  for RW and  $\nu=0.587597(7)\dots^1$  for SAW in d=3 and mathematically,

- Self-avoidance turns a simple Markovian random walk without memory into a complicated non-Markovian random walk with infinite memory
- When growing a self-avoiding walk, one needs to test for self-intersection with all previous steps

<sup>1</sup>N Clisby, PRL **104** 055702 (2010), using the Pivot Algorithm  $\rightarrow \langle z \rangle \langle z \rangle = \langle 0 \rangle$ 

Interacting Self-avoiding Walks The HP model

#### "Realistic" Lattice Models of Polymers

A self-avoiding walk lattice model of a polymer tethered to a sticky surface under the influence of a pulling force.

# From Polymer Collapse to Protein Folding

Proteins are highly complicated chains of amino acids

The Hydrophobic-Polar lattice path model

- $\bullet~\mbox{Protein chain} \to \mbox{self-avoiding walk}$
- $\bullet$  Amino acids  $\rightarrow$  hydrophobic (H) and polar (P) monomers^2
- Short-range interaction, for example

$$\epsilon_{HH}=-1\;,\quad \epsilon_{HP}=0\;,\quad \epsilon_{PH}=0\;,\quad \epsilon_{PP}=0$$

#### **Optimization Problem**

Given a fixed sequence of H's and P's, find the ground state of the chain.

<sup>2</sup>K. A. Dill, Biochemistry **24**, 1501 (1985)

#### Ground State Search

Many optimization algorithms have been used

- Simulated Annealing
- Branch-and-Bound
- Constraint Satisfaction Programming
- Markov-Chain Monte Carlo
- Stochastic Growth Methods

Finding the ground state is an NP-hard problem<sup>a</sup>

<sup>a</sup>B. Berger and T. Leighton, J. Comp. Biol. 5, 27 (1998)

・ 同 ト ・ ヨ ト ・ ヨ ト

Interacting Self-avoiding Walks The HP model

## Sampling Algorithms

Markov Chain Monte Carlo (MCMC) Methods

- Transition from state i to state j with probability  $P_{i,j}$
- Ergodicity
- Detailed Balance Condition for Equilibrium

$$\pi_i P_{i,j} = \pi_j P_{j,i}$$

• Normally fixed system size (e.g. constant number of spins)

Stochastic Growth Methods

- No Markov Chain
- Grow independent configurations from scratch
- Incomplete enumeration

At each growth step, select one of all possible continuations

## Simple Random Walk in One Dimension

Model of directed polymer in 1 + 1 dimensions

- Start at origin and step to left or right with equal probability
- $2^n$  possible random walks with *n* steps
- each walk generated with equal weight

Distribution of endpoints

• walks end at position k + (n - k) with probability

$$P_{n,k} = \frac{1}{2^n} \binom{n}{k}$$

(k steps to the right, n - k steps to the left)

不得い イヨト イヨト

Simple Sampling Biased Sampling Uniform Sampling Pruned and Enriched Sampling Blind Pruned and Enriched Sampling

#### Properties of Simple Sampling

- Samples grown independently from scratch
- Each sample of an *n*-step walk is grown with equal probability
- Impossible to sample the tails of the distribution  $(P_{n,0} = 2^{-n})$

How can we tweak the algorithm to reach the tails?

Simple Sampling Biased Sampling Uniform Sampling Pruned and Enriched Sampling Blind Pruned and Enriched Sampling

#### **Biased Sampling**

Introduce bias

- Jump to left with probability p
- Jump to right with probability 1-p

Distribution of endpoints

• Walks end at position k + (n - k) with probability

$$P_{n,k} = \binom{n}{k} p^{n-k} (1-p)^k$$

(k steps to the right, n - k steps to the left)

・ 同 ト ・ ヨ ト ・ ヨ ト

Biased sampling of simple random walk for n = 50 steps and bias p = 0.85 (green), p = 0.5 (blue), and p = 0.15 (red). For each simulation, 100000 samples were generated.

nar

→ Ξ ► < Ξ ►</p>

Simple Sampling Biased Sampling Uniform Sampling Pruned and Enriched Sampling Blind Pruned and Enriched Sampling

## Properties of Biased Sampling

- Samples grown independently from scratch
- Each sample of an *n*-step walk ending at position *k* is grown with equal probability
- Distributions concentrated around k = pn with width  $O(\sqrt{n})$
- To cover the whole distribution, need  $O(\sqrt{n})$  individual simulations
- Need to choose different biases p such that distributions overlap

Can we tweak the algorithm to avoid several simulations?

イロト イポト イラト イラト

Simple Sampling Biased Sampling Uniform Sampling Pruned and Enriched Sampling Blind Pruned and Enriched Sampling

#### **Uniform Sampling**

#### Main Idea

Allow for *local* biassing of random walk

• replace global bias p by local bias

$$p_{n,k} = \frac{n+1-k}{n+2}$$

• Change weight of configuration by factor

$$1/2p_{n,k}$$
 or  $1/2(1-p_{n,k})$ 

▲ 同 ▶ ▲ 国 ▶ ▲ 国 ▶

Simple Sampling Biased Sampling Uniform Sampling Pruned and Enriched Sampling Blind Pruned and Enriched Sampling

Uniform sampling of simple random walk for n = 50 steps, with 100000 samples generated.

・ 同 ト ・ ヨ ト ・ ヨ ト

SOC

Simple Sampling Biased Sampling Uniform Sampling Pruned and Enriched Sampling Blind Pruned and Enriched Sampling

## Properties of Uniform Sampling

- Samples grown independently from scratch
- Each sample of an *n*-step walk ending at position *k* is grown with equal probability

$$P_{n,k} = \frac{1}{n+1}$$

and has weight

$$W_{n,k}=\frac{n+1}{2^n}\binom{n}{k}$$

- Distribution is perfectly uniform
- One simulation suffices

What if we don't know how to compute the biases  $p_{n,k}$ ?

Simple Sampling Biased Sampling Uniform Sampling **Pruned and Enriched Sampling** Blind Pruned and Enriched Sampling

## From Biases to Weights: A Change of View

- Correct choice of local biases  $p_{n,k}$  achieves uniform sampling
- If local biases are incorrect, sampling will be non-uniform

#### Idea

Use this non-uniformity to iteratively tune weights

・ 同 ト ・ ヨ ト ・ ヨ ト

Simple Sampling Biased Sampling Uniform Sampling **Pruned and Enriched Sampling** Blind Pruned and Enriched Sampling

## Pruned and Enriched Sampling

• For uniform sampling we need to achieve

$$W_{n,k} = \frac{n+1}{2^n} \binom{n}{k}$$

• Simple sampling generates samples with weight  $W_{n,k} = 2^{-n}$ 

#### Pruning and Enrichment Strategy

- **Pruning** If the weight is too small, remove the configuration probabilistically
- **Enrichment** If the weight is too large, make several copies of the configuration

・ロト ・ 同ト ・ ヨト ・ ヨト

# Pruning and Enrichment (ctd)

Suppose a walk has been generated with weight w, but ought to have target weight W.

- Compute ratio R = w/W
- If R = 1, do nothing
- If R < 1, stop growing with probability 1 R
- If R > 1, make  $\lfloor R \rfloor + 1$  copies with probability  $p = R \lfloor R \rfloor$  and  $\lfloor R \rfloor$  copies with probability 1 p
- Continue growing with weight w set to target weight W

Pruning and enrichment leads to the generation of a tree-like structure of correlated walks. All walks grown from the same seed are called a *tour* 

#### Drawback of Pruning and Enrichment

- Need to deal with correlated data
- No a priori error analysis available
- A posteriori error analysis very difficult (only heuristics)

Pruned and enriched sampling of simple random walk for n = 50 steps, with 100000 tours generated.

Simple Sampling

Rosenbluth Sampling Pruned and Enriched Rosenbluth Sampling Flat Histogram Rosenbluth Sampling Applications

## Simple Sampling of Self-Avoiding Walk

From now on, consider Self-Avoiding Walks (SAW) on  $\mathbb{Z}^2$ 

- Simple sampling of SAW works just like simple sampling of random walks
- But now walks get removed if they self-intersect

イロト 不得 トイヨト イヨト
#### Simple Sampling

Rosenbluth Sampling Pruned and Enriched Rosenbluth Sampling Flat Histogram Rosenbluth Sampling Applications

# Properties of Simple Sampling

- Samples grown independently from scratch
- Each sample of an *n*-step self-avoiding walk is grown with equal probability

However

Generating SAW with simple sampling is very inefficient

- There are 4<sup>n</sup> *n*-step random walks, but only about 2.638<sup>n</sup> *n*-step SAW
- The probability of successfully generating an *n*-step SAW decreases exponentially fast

This is called exponential attrition

イロト イポト イラト イラト

Simple Sampling Rosenbluth Sampling Pruned and Enriched Rosenbluth Sampling Flat Histogram Rosenbluth Sampling Applications

# Rosenbluth Sampling

A slightly improved sampling algorithm was proposed in 1955 by Rosenbluth and Rosenbluth  $^{\rm 4}.$ 

- Avoid self-intersections by only sampling from the steps that don't self-intersect
- The growth only terminates if the walk is trapped and cannot continue growing

Still exponential attrition (albeit less)

Configurations are generated with varying probabilities, depending on the number of ways they can be continued

<sup>4</sup>M. N. Rosenbluth and A. W. Rosenbluth, J. Chem. Phys. 23 356 (1955) = 🕞 🖉 a C

Simple Sampling Rosenbluth Sampling Pruned and Enriched Rosenbluth Sampling Flat Histogram Rosenbluth Sampling Applications

# The "Atmosphere" of a configuration

We call *atmosphere a* of a configuration the number of ways in which a configuration can continue to grow.

- For simple random walks, the atmosphere is constant
- For 2-dim SAW, the atmosphere varies between a = 4 (seed) and a = 0 (trapped)

If a configuration has atmosphere *a* then there are *a* different possibilities of growing the configuration, and each of these can get selected with probability p = 1/a, therefore the weight gets multiplied by *a*.

An *n*-step walk grown by Rosenbluth sampling therefore has weight

$$W_n = \prod_{i=0}^{n-1} a_i$$

and is generated with probability  $P_n = 1/W_n$ , so that  $P_nW_n = 1$  as required.

## Interacting Self-Avoiding Walks

Consider sampling with respect to an extra parameter, for example the number of nearest-neighbour contacts

An interacting self-avoiding walk on the square lattice with n = 26 steps and m = 7 contacts.

Simple Sampling Rosenbluth Sampling Pruned and Enriched Rosenbluth Sampling Flat Histogram Rosenbluth Sampling Applications

# **Uniform Sampling**

Renewed interest in Uniform Sampling Algorithms

F. Wang and D. P. Landau, PRL 86 2050 (2001)

- Multicanonical PERM
  - M. Bachmann and W. Janke, PRL 91 208105 (2003)
- Flat Histogram PERM

T. Prellberg and J. Krawczyk, PRL 92 120602 (2004)

ヘロト 人間ト ヘヨト ヘヨト

Incorporating uniform sampling into PERM is straightforward, once one observes that PERM already samples uniformly *in system size* 

Simple Sampling Rosenbluth Sampling Pruned and Enriched Rosenbluth Sampling Flat Histogram Rosenbluth Sampling Applications

# Flat Histogram Rosenbluth Sampling

Extension of PERM to a microcanonical version

- Distinguish configurations of size *n* by some additional parameter *m* (e.g. energy)
- Bin data with respect to n and m

 $s_{n,m} \leftarrow s_{n,m} + 1, w_{n,m} \leftarrow w_{n,m} + Weight_n$ 

• Enrichment ratio for pruning/enrichment becomes

 $Ratio \leftarrow Weight_n/W_{n,m}$ 

And that is all!

# **ISAW** simulations

T Prellberg and J Krawczyk, PRL 92 (2004) 120602

Thomas Prellberg

- 2d ISAW up to n = 1024
- One simulation suffices
- 400 orders of magnitude

(only 2d shown, 3d similar)

Simple Sampling Rosenbluth Sampling Pruned and Enriched Rosenbluth Sampling Flat Histogram Rosenbluth Sampling Applications

# Simulation results: SAW in a strip

T Prellberg et al, in: Computer Simulation Studies in Condensed Matter Physics XVII, Springer Verlag, 2006

• 2d SAW in a strip: strip width 64, up to n = 1024

Scaled endpoint density

Simple Sampling Rosenbluth Sampling Pruned and Enriched Rosenbluth Sampling Flat Histogram Rosenbluth Sampling Applications

# HP model simulations

T Prellberg et al, in: Computer Simulation Studies in Condensed Matter Physics XVII, Springer Verlag, 2006

• Engineered sequence HPHPHHPHPHPH in d = 3:

- Pedagogical example, engineered for native ground state
- Perfect agreement with exact enumeration
- Clearly visible collapse transition (right peak) and folding transition (left peak)

→ ∃ → → ∃ →

Simple Sampling Rosenbluth Sampling Pruned and Enriched Rosenbluth Sampling Flat Histogram Rosenbluth Sampling Applications

# HP model simulations

T Prellberg et al, in: Computer Simulation Studies in Condensed Matter Physics XVII, Springer Verlag, 2006

• Sequence of 85 monomers in d = 2:

- Investigated other sequences up to  $N \approx 100$  in d = 2 and d = 3
- Collapsed regime accessible
- Reproduced known ground state energies
- Obtained density of states  $C_{n,m}$  over large range ( $\approx 10^{30}$ )

  - Interacting Self-avoiding Walks
  - The HP model
- 2 Sampling of Simple Random Walks
  - Simple Sampling
  - Biased Sampling
  - Uniform Sampling
  - Pruned and Enriched Sampling
  - Blind Pruned and Enriched Sampling
- 3 Sampling of Self-Avoiding Walks
  - Simple Sampling
  - Rosenbluth Sampling
  - Pruned and Enriched Rosenbluth Sampling
  - Flat Histogram Rosenbluth Sampling
  - Applications
  - Extensions
    - Generalized Atmospheric Rosenbluth Sampling

# Extensions

PERM (and its flat histogram version) can be applied objects that are grown in a unique way

Generalized Atmospheric Rosenbluth Sampling

- prime example: linear polymers
- but also: permutations (insert n + 1 into a permutation of  $\{1, 2, ..., n\}$ )

What about objects that can be grown in different, not necessarily unique, ways?

• examples: ring polymers, branched polymers (lattice trees)

# Positive and Negative Atmospheres

A. Rechnitzer and E. J. Janse van Rensburg, J. Phys. A **41** 442002 (2008)

### Key idea

Introduce an additional negative atmosphere  $a^-$  indicating in how many ways a configuration can be reduced in size

- For linear polymers the negative atmosphere is always unity, as there is only one way to remove a step
- For lattice trees the negative atmosphere is equal to the number of its leaves

ヘロト ヘ戸ト ヘヨト ヘヨト

# Generalized Atmospheric Rosenbluth Sampling

A new algorithm: Generalized Atmospheric Rosenbluth Method (GARM)

• An *n*-step configuration grown has weight

$$W_n = \prod_{i=0}^{n-1} \frac{a_i}{a_{i+1}} , \qquad (1)$$

イロト イポト イヨト イヨト

SOR

where  $a_i$  are the (positive) atmospheres of the configuration after i growth steps, and  $a_i^-$  are the negative atmospheres of the configuration after i growth steps.

• The probability of growing this configuration is  $P_n = 1/W_n$ , so again  $P_n W_n = 1$  holds as required.

# Generalized Atmospheric Rosenbluth Sampling

- Implementing GARM is straightforward
- Computation of atmospheres might be expensive
- Can add pruning/enrichment
- Can extend to flat histogram sampling

### Other developments

- add moves that don't change the system size ("neutral" atmosphere)
- grow and shrink independently (Generalized Atmospheric Sampling, GAS)

For further extensions to Rosenbluth sampling, and indeed many more algorithms for simulating self-avoiding walks, as well as applications, see the review "Monte Carlo methods for the self-avoiding walk," E. J. Janse van Rensburg, J. Phys. A **42** 323001 (2009)
